CSE 30331  
Program 1 Milestones

**Project:** Audacity

**Group Members:** Lucinda KrahI

**Run On:** Linux Ubuntu VM

**GM5:**

My partner Lucinda has been working on installing dependencies and pulling the code for Audacity on a Linux VM she has set up. I am running into issues setting up a VM on my machine, so my next steps will be to seek help either at office hours or from my peers in getting an Ubuntu VM set up and running correctly. From there, I will follow the same steps Lucinda has done to get Audacity compiled on my computer with the correct dependencies.

**GM6:**

The Audacity community has an email submission format suggested for the report of bugs found by users, requests for new features in the application. So, the bug fixes and feature requests are collected by the developers using the Audacity email. The current bugs in Audacity are tracked using *Bugzilla*, which will be a good starting point for us to find parts of Audacity that we can work on. In order to allow submissions of patches, Audacity provides a wiki page with information about submitting code patches using subversion control. It gives further information about informing the developers about your patch so they can allow it through.

Audacity also has a mailing list for developers for updates and information about the code development. Lucinda and I have both signed up for the mailing list, but we have not yet received anything.
